

# Cairo REST API

## Quick reference guide

This diagram shows the endpoints you can use with the Cairo API. Most endpoints allow you to go directly to the resource or use an include for the resource (shown as **?includes=**). If you use an include for the resource, the resource gets added as an array inside the array of the resource you go directly to. **111, 222, 333** refer to the ID of the site, player, team, mission, etc., and supplies the context for many endpoints. If you're using sandbox instead of production, change **api.v2** to **sandbox** in the base path.
